

Updating your Symantec Antivirus Manually

Your laptop has Symantec Antivirus installed on it. This software protects your computer from viruses. The software needs to have up-to-date definitions downloaded to it so that it knows what viruses to look for. When you log into the Novell network either by logging in *without* the “workstation only” option, or by right clicking on the Red N in your system tray after and logging in, your virus definitions are updated automatically. Connecting wirelessly does not update your definitions unless you log into the network. If you are not regularly logging into the network, you need to update your definitions manually. To do this, please follow the directions below:

1. Double click the gold shield icon in the system tray.
2. In the window that appears, click *Live Update*.

3. At the Live Update screen click *Next* to install the updates. After the updates have finished downloading, click *Finish*.
